Oikosteges 1 & 8 (OS1, OS8) are patented, green roof and green wall technologies. The technologies were specially designed for the demanding urban environments of the Mediterranean. Both approaches offer unique solutions to urban greening (roof and wall greening) in possibly one of the most challenging climates and geologies on Earth. OS are the only purposely designed and developed for green roofs and walls in the Mediterranean. The methods provide a number of comparative advantages, over systems developed in and for Central and Northern Europe, both for the buildings where they are installed and for the whole urban environment, solving a large number of issues faced by residents of cities

- Specifically OS1 and OS8 are :
- **Developed and designed for Mediterranean buildings** - feather lightweight (for earthquake zones) modular, permanently portable and waterproof
- Developed and designed for the demands encountered on Mediterranean roofs and walls (long droughts (both hot and cold), high solar exposure, ice, snow, gale force hot and cold winds, torrential monsoon-like downpours).
- Self-sustaining, no requirement for any post installment intervention or maintenance. No requirement for any further inputs of substrate, no requirement for fertilization, no use of chemicals whatsoever, low to no irrigation requirement, no requirement for pruning or mowing.
